

Useful tips on finding leaks

SAVE WATER AND MONEY BY FIXING LEAKS EARLY

HOW TO SPOT SIGNS OF A LEAK

Check for unusually high water bills

Listen for the sound of water running or constant dripping during the night even when no appliances are in use

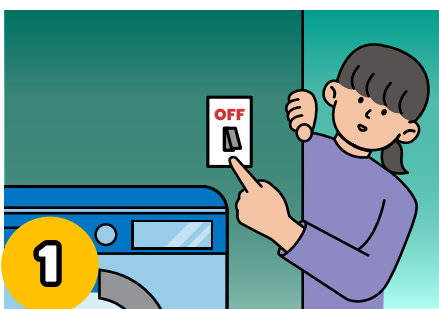

Look for signs of mould, discolouration or peeling paint on walls, flooring or ceilings

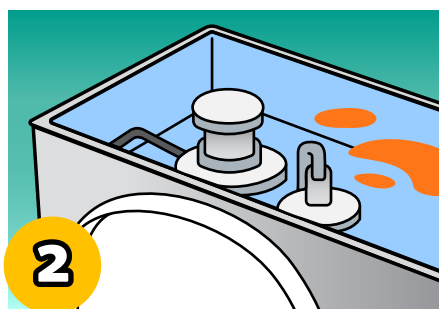

Sniff for foul odours in an area with no other obvious source

HOW TO CONFIRM IF THERE IS A LEAK

Turn off all taps and appliances using water, and monitor your water meter for at least 10 minutes. If the meter dial moves, there is a leak.

Sprinkle food colouring (or drop a leak detection tablet) into the flushing cistern tank, and observe the toilet bowl for any coloured water. ***Did you know a leaking flushing cistern tank can lose more than 10 litres of water per hour?***

Look out for dripping taps and water stains, mould or peeling material under the sink area. ***Did you know a leaking tap can lose up to 2 litres of water per hour?***

Always engage a licensed plumber who is qualified to detect and repair leaks. You can find a list of Licensed Plumbers at go.gov.sg/licensed-plumbers-info.

Note: Prolonged leaks will lead to high water bills, water wastage and may cause damage to your property.
